No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                   US-09-826-581-5

```
This sequence represents the full length cDNA encoding the human AMP-activated protein kinase gamma 3 subunit (PRKAG3). Detecting the presence of the PRKAG3 DNA, or a variant, is useful in determining a risk estimate of a metabolic disease, such as diabetes or obesity, in a subject. The variation may occur in exons 3, 4 or 10. In exon 3 variation may be a substitution of a G for a C at nuclectide 320, resulting in the amino acid substitution p71A; in exon 4 variation may be a substitution of a T for a C at nuclectide 550; and in exon 10 variation may be a substitution of a T for a C at nuclectide 1037, resulting in the amino acid substitution R340M. There may also be conclected variation in infrom 6. The numbering of these variations is based on the full length cDNA as given, rather than on the proper reading frame.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a cDNA encoding human adenosine monophosphate (AMP)-activated kinase (AMPK) gamma subunit muscle-specific isoform, complete PRKAG3. Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as therapeutic for treating carbohydrate metabolism disorders as diabetes, obesity, and disorders associated with muscle metabolism such as myopathy and cardiovascular diseases, to modulate AMPK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       preferably a carbohydrate metabolism disorder. Frimers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allele of PKKAG3. Transgenic animal and host cell transformed with PKKAG3 a
                                                                                                                                                                                                                                                     Human; gamma subunit; adenosine monophosphate-activated kinase; AMPK; PRKAG3; diabetes; obesity; myopathy; cardiovascular disease; anorectic; genetic testing; carbohydrate metabolism disorder; skeletal muscle;

heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPK activity. Nucleic acid encoding PKKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain of PKKAG3 and is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                     635 TTCGACACCATGCTGGAGATCAAGAAGGCCTTCTTTGCTCTGGTGGCCAACGGTGTGCGG

The present sequence is a cDNA encoding human adenosine monophosphate (AMP) gamma subunit muscle-specific isoform, PRKAG3. Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as therapeutic for treating carbohydrate metabolism disorders associated with muscle metabolism as diabetes, obesity, and disorders associated with muscle metabolism cuch as myopathy and cardiovascular disease, to modulate AMPK cartivity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic evaluation, genetic testing and prognosis of a metabolic disorder, preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allele of PRKAG3.

Transgenic animal and host cell transformed with PRKAG3 or a chetectrimenic AMPK consisting of PRKAG3 or its mutant, are useful for encoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain of PRKAG3 and is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   460

The present sequence is pig adenosine monophosphate (AMP)-activated kinase (AMFK) gamma subunit muscle-specific isoform, PRKAG3 splice variant DNA. Prkag3 gene is located in the RN locus of chromosome 15. Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as therapeutic for treating carbohydrate metabolism disorders such as diabetes, obesity, and disorders associated with muscle metabolism activity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic and its functionally altered mutants are useful for the diagnostic evaluation, genetic testing and prognosis of a metabolic disorder, preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting AGGGAACTGGAGAACTCAGCCTTCATCTTCCCCCACCCCCATTTGCTGGTTCAGCTATGA 1600 Pig; gamma subunit; adenosine monophosphate-activated kinase; AMPK; preprior obesity; myopathy; cardiovascular disease; anorectic; genetic testing; carbohydate metabolism disorder; skeletal muscle; cystathione beta synthase; CBS; cardiant; gene therapy; ds. New variants of the gamma subunit of vertebrate adenosine monophosphate-activated kinase for diagnosis or treatment of disorders associated with energy metabolism such as diabetes, obesity, and ت Looft C, Kalm E, Milan D, Robic A, Rogel-Gaillard, Gellin J, Le Roy P, Chardon P; /*tag= a /product= "Sus scrofa Prkaq3 splice variant" TTCAGGTAGGCTCTGCCCTGGGCCATGACACCAGCCT 1637 1494 rrcaggerrerrcageerrecaaaarrgeerrrgeer 1530 NAT RECH AGRONOMIQUE. from the expression of a functionally altered allele of PRKAG3.
Transpentc animal and host cell transformed with PRKAG3 or a heterotrineric AMPK consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPK activity. Nucleic acid encoding PRKAG3 is useful for detecting mutations in a PrKag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain of PRKAG3 and is useful in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     477
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for screening animals to determine those more likely to produce large litters and improved meat quality traits. The method involves assaying for the presence of a genetype in the sample of genetic material obtained from animal. The genotype is characterised by polymorphism(s) in the AMP activated protein kinase requlatory gamma subunit (PRKAG3) gene. The method is used for screening animals e.g., pigs to determine those most likely to exhibit improved meat quality traits and to produce larger litters. The present sequence is pig PRKAG3 polymorphic variant DNA (PRKAG3-30).
                                                                                                                                                                                                                                                                         Screening animals to determine those likely to produce larger litters and improved meat quality traits involves assaying for the presence of polymorphisms in the AMP activated protein kinase regulatory gamma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GIGCTGTTACCCAGGCTGGGCTGGGATGAGCTGCAGAAGCCGGGGGCCCAGGTCTAC

The present sequence is a cDNA encoding pig adenosine monophosphate (AMP)-activated kinase (AMPK) gamma subunit muscle-specific isoform, complete PRRAG3: Prkag3 agene is located in the RN locus of chromosome 15. Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRRAG3 is useful as therapeutic for treating carbohydrate metabolism disorders such as diabetes, obesity, and disorders associated with muscle metabolism such as myopathy and cardiovascular diseases, to modulate AMPK activity, and for restoring a normal AMPK function. PRRAG3 sequence and its functionally altered mutants are useful for the diagnostic evaluation, genetic testing and prognosis of a metabolic disorder, preferably a carbohydrate metabolism disorder. Primers that can detect general for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered alalele of PRRAG3 or a functional and host cell transformed with PRRAG3 or a function and host cell transformed with PRRAG3 or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         screening compounds able to modulate AMPK activity. Nucleic acid encoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain of PRKAG3 and is useful in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GCCCCATTTCCCAAGCTGGGCTGGGATGACGAACTGCGGAAACCCGGCCCCAGATCTAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method for screening animals to determine those more likely to produce large litters and improved meat quality traits. The method involves assaying for the presence of a genotype in the sample of genetic material obtained from animal. The genotype is characterised by polymorphism(s) in the AMP activated protein kinase regulatory gamma subunit (PRRAG3) gene. The method is used for screening animals e.g., pigs to determine those most likely to exhibit improved meat quality traits and to produce larger litters. The present sequence is pig wild-type PRRAG3 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                     The invention relates to a method for screening animals to determine those more likely to produce large litters and improved meat quality traits. The method involves assaying for the presence of agenotype in the sample of genetic material obtained from animal. The genotype is characterised by polymorphism(s) in the AMP activated protein kinase regulatory gamma subunit (PRKAG3) gene. The method is used for screening animals e.g., pigs to determine those most likely to exhibit improved meat quality traits and to produce larger litters. The present sequence is pig PRKAG3 polymorphic variant DNA (PRKAG3-22).
Screening animals to determine those likely to produce larger litters and improved meat quality traits involves assaying for the presence of polymorphisms in the AMP activated protein kinase regulatory gamma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TCAGAAAGAATCCGTGGGAAACGGAGGCCCAAAGCCTTGAGATGGACAAGGCAGAAGTCG

The method involves assaying for the presence of a genotype in the sample of genetic material obtained from animal. The genotype is characterised by polymorphism(s) in the AMP activated protein kinase regulatory gamma subunit (PRRAG3) gene. The method is used
                                                                                                                                                                                                                                                                                                                                                                AMP activated protein kinase regulatory gamma subunit; PRKAG3 gene; screening; meat quality; single nucleotide polymorphism; SNP; pig; gene; variant; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                     The invention relates to a method for screening animals to determine those more likely to produce large litters and improved meat quality traits. The method involves assaying for the presence of a genotype in the sample of genetic material obtained from animal. The genotype is characterised by polymorphism(s) in the AMP activated protein kinase regulatory gamma subunit (PRKAG3) gene. The method is used for screening animals e.g., pigs to determine those most likely to exhibit improved meat quality traits and to produce larger litters. The present sequence is pig PRKAG3 polymorphic variant DNA (PRKAG3-200)
                                                                                                                                                  Screening animals to determine those likely to produce larger litters and improved meat quality traits involves assaying for the presence of polymorphisms in the AMP activated protein kinase regulatory gamma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GCCCCATTTCCCAAGCTGGGCTGGGATGACGAACTGCGGAAACCCGGCGCCCAGATCTAC

The present sequence is a cDNA encoding pig adenosine monophosphate (AMP) activated kinase (AMPK) gamma subunit muscle-specific isoform, PRKAG3. Prkag3 gene is located in the RN locus of chromosome 15.

Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as therapeutic for treating carbohydrate metabolism disorders such as the constitution and disorders associated with muscle metabolism such as myopathy and cardiovascular diseases, to modulate AMPK activity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic evaluation, genetic testing and prognosis of a metabolic disorder, preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allele of PRKAG3.

Transgenic animal and host cell transformed with PRKAG3 or a heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for encoding PRKAG3 is useful for detecting mutations in a PrkaG3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain compounds and is useful in gene therapy.
                          Pig; gamma subunit; adenosine monophosphate-activated kinase; AMPK; PRKAG3; diabetes; obesity; myopathy; cardiovascular disease; anorectic; genetic testing; carbohydrate metabolism disorder; skeletal muscle; cystathione beta synthase; CBS; cardiant; gene therapy; RN locus; chromosome 15; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New variants of the gamma subunit of vertebrate adenosine monophosphate-activated kinase for diagnosis or treatment of disorders associated with energy metabolism such as diabetes, obesity, and

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABB0825-ABBA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, and sequences against the polypeptides, methods of detecting the nucleotides or polypeptides of the invention have homology to known proteins, thereby polypeptides of the invention have homology to known proteins, thereby polypeptides of the invention have homology to known proteins, thereby propertides of the invention have homology to known proteins, thereby proteins an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities; seem cell growth factor activity; hammatopolatatory activity; issue growth activity; hammatopolatatory activity; tissue growth activity; hemanatopolates required activities; neceptor or inhabin-related activities; chemotactic or chemokinetic activities; hammatopolates activities; chemotactic or chemotactic activities; neceptor or inhabin-related activities; chemotactic or chemotactic or chemotactic activities; permodely to activities; confidence of involved in oncogenesis, cancer cell proliferation or metastasis.

Companion on their biological activities; polypeptides and nucleicals of involved in oncogenesis, cancer cell proliferation or material schemala, bromediactory activities; cornary heart disease, conditions, e.g., by protein or gene therapy. Such conditions include cancers, hemantopolatic disorders (e.g., mysloid or lympholatic disorders.) chronic inflammatory conditions; cornary heart disease, arterial isonemia, bone disorders (e.g., mysloid or lympholatic activities involved with tissue regeneration and creating infections in additions (e.g., asthma or strain inflammatory activities may be used to promote cell growth. For example, such polypeptides and nuclein or propertion in maintenance 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The sequences given in AAH43681-84 represents genomic fragments encoding the human AMP-activated protein kinase gamma 3 subunit (PRKAG3). Detecting the presence of the PRKAG3 DNA, or a variant, is useful in determining a risk estimate of a metabolic disease, such as diabetes or obesity, in a subject. The variation may occur in exons 3, 4 or 10. In exon 3 variation may be a substitution of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             719
a G for a C at nucleotide 320, resulting in the amino acid substitution P71A; in exon 4 variation may be a substitution of a T for a C at nucleotide 550; and in exon 10 variation may be a substitution of a T for a C at nucleotide 1037, resulting in the amino acid substitution R340W. There may also be nucleotide variation

```
The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated the expression level to an expression level in an unactivated of GCA.

Also included are modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in GS; (2) screening (M3) for an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the chronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the chronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a print of expression of the gene is indicative of inflammation.

CC (4) treating (M5) an inflammatory disease, by contacting a subject to a pathogen or sterile inflammatory disease, by contacting a subject to a pathogen or sterile (GCA preferably in an inflammation (especially chronic) in a tissue, an allergic casponse in a subject, exposure of a subject to a pathogen or sterile or response in a subject, exposure of a subject to a pathogen or sterile or response in a subject, exposure of a subject to a pathogen or sterile or response in a subject, exposure of a subject to a pathogen or sterile or response in a subject, seasonse in a subject, an allergic cresponse in a subject, social arthritis, and an analysing or an allergic cresponse in a subject, exposure of a subject to a pathogen or sterile or response in a subject in a subject in a subject in a subject in a subject or a pathogen or sterile or response in a subject in a subject in a subject in a subject in a subject in a subject in a subject or an allergic cresponse in a subject in a subject in a subject i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

New nucleic acid that is a pancreatic cancer antigen for preventing, treating, or ameliotating a medical condition, particular pancreatic PT treating, or ameliotating a medical condition, particular pancreatic PT cancer, or for use in assays for diagnosing a pathological condition - PT cancer, or for use in assays for diagnosing a pathological condition - CC AAB5466. The human pancreatic cancer antigens, given in AAB54008 to AAB5466. The human pancreatic cancer antigens, pave cytostatic, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, cc in gene therapy. The polynuclecifide and proteins and be used for preventing, treating, or ameliorating a medical condition or in assays (cr diagnosing a pathological condition or a susceptibility to one in a consuject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer.

C Agonists and antagonists to the antigens can be used to design nucleic cancer antigen polyuculectides can be used to design nucleic and diagnostic methods. The proteins can be used to design nucleic can diagnostic methods. The proteins can be used to design nucleic and diagnostic methods. The proteins can be used to design nucleic content near used to purity, detect and target the polypeptides, including proteins can be used to treat or prevent neural, immune system, muscular, correproductive, quastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders. AA99232 to AA99240 and AAA9447 represent proliferative disorders. AA99232 to AA99240 and AAB5447 represent proliferative disorders. AA9922 to AA99240 and AAB5447 represent proliferative disorders. AA9922 to AA99240.
